

EDUCATION

Sreenidhi University B.Tech. - Artificial Intelligence and Machine Learning CGPA: 9.66 / 10	2024 - 2028
SR JUNIOR COLLEGE 12 th TSBIE Percentage: 97.30 / 100	2023
MJPTBCWREIS 10 th BSET CGPA: 10 / 10	2021

PROJECTS

Auto_Lane_Detection Team Size: 3 Key Skills: Technologies Used :Python ,OpenCV, NumPy, Machine Learning / Deep Learning, Jupyter Notebook / VS Code Project Link: https://github.com/sahith0405/auto_lane_detection Auto Lane Detection is an intelligent computer vision-based system designed to automatically identify and track road lane markings in real time. The project improves driving safety and supports Advanced Driver Assistance Systems (ADAS) by helping vehicles stay within lane boundaries. The system uses image processing and deep learning techniques to detect lanes from road video streams or camera input. It processes each frame by applying preprocessing methods such as grayscale conversion, edge detection, region masking, and lane line extraction. The detected lanes are then highlighted on the road for accurate visualization. This project is useful for: Self-driving car technology Driver assistance systems Accident prevention Smart transportation systems Key Features Real-time lane detection Edge and line detection using computer vision Works on road images and video streams Improved driving assistance and safety Efficient and accurate lane tracking Outcome The project successfully detects road lanes with good accuracy under normal driving conditions and demonstrates how AI and computer vision can enhance modern transportation systems.	01 Apr, 2026 - 30 Apr, 2026

Smart AI-Based Parking Management System Using Image Processing

Team Size: 6

Key Skills: Programming, Image Processing, Web Development, Database Management, System Design

The Smart Parking Management System is an automated solution designed to monitor and manage parking spaces efficiently using image processing and sensor-based technologies without machine learning algorithms. The system aims to reduce traffic congestion, save time for drivers, and improve parking space utilization.

In this system, cameras or sensors are installed in the parking area to monitor parking slots. Using image processing techniques, the system detects whether a parking space is occupied or vacant by analyzing real-time images. The availability status of parking slots is updated automatically and displayed on a web interface or digital display board.

Users can check available parking spaces before parking their vehicles, which reduces unnecessary searching and fuel consumption. The system also helps administrators monitor parking usage, maintain records, and manage vehicle entry and exit efficiently. This project demonstrates how automation and basic artificial intelligence concepts can be applied to develop smart infrastructure solutions without relying on complex machine learning models.

ASSESSMENTS / CERTIFICATIONS

Drone Technology Bootcamp

Provider: NIELIT Aurangabad

PERSONAL DETAILS

Gender: Male

Marital Status: Single

Current Address: Yamnampet, Gatkesar, Hyderabad,
Telangana, India - 501301

Email: 24011cseai0043@aiml.suh.edu.in

Date of Birth: 15 Apr, 2005

Known Languages: Telugu, English, Hindi

Phone Numbers: +91-9866656723, +91-9502080146
